FT-N Vickers

Electrohydraulic Controls Manual

Test Box EHA-TEQ-460-A-10 Assembly Number 02-326 127

General Description

The Test Box is designed to test Proportional Valves and their electronics. The equipment is useful for hydraulic valves with integrated electronics, i.e.; KB-valves. The Test Box has an internal supply for 24V and 12V, which can supply one valve. The mains lead connects the test box with the outlet. The range from the main supply is 100V to 250V. A special cable connects the Test box with the electronics of the valve.

Features and Benefits

- LCD-panel for measurement several input and output signals (Voltage, command signal, main current and coil current)
- Own Power Supply
- Extra Command signal, ramp and additional Gain and Offset control
- Display for over or under voltage alarm and over current alarm

Housing:		-Robust epoxy plastic case, color: black -Watertight (30 feet) and airtight protect	-Robust epoxy plastic case, color: black -Watertight (30 feet) and airtight protected by closed cover		
Dimension:		27,3cm x 24,cm x 17,8cm (10.7" x 9.5" x 7"	27,3cm x 24,cm x 17,8cm (10.7" x 9.5" x 7")		
Temperature range operating: Storing		0 to 50°C -20°C to 70°C			
Mass		0,7 kg (1.54 lb)			

Test Proceedure for KB- Valve

With all hydraulic and electrical power turned off, connect the TEQ to the valve by setting the SUPPLY switch (2) to either 12 or 24 volts as required by the valve. Switch the POWER (1) to ON, the SUPPLY switch (5) to INT, and turn the GAIN potentiometer (14) to 100%. The valve can now be driven progressively in either direction by first setting the +100%/0/-100% switch (10) to +100% or -100% to select the direction and then turn the

COMMAND potentiometer (11) slowly clockwise (CW) until the required speed is achieved. Reverse operation can be achieved by reversing the +100%/0/-100% switch (10), and again turn the COMMAND potentiometer (11) slowly clockwise. Step inputs can be generated by pre-setting the amplitude of the input on the COMMAND potentiometer (11), and toggling the 100%/0/+100% switch (10) between on and off.

Setting the RAMP and OFF-SET potentiometers as necessary can simulate the circuit conditions. The GAIN control can be used to set the maximum output when the COMMAND potentiometer is turned fully clockwise. This means that the GAIN can be fully attenuated from zero to full output with only a 50% setting on the COM-MAND potentiometer. The GAIN control will be most useful for adjusting externally generated signals, which allows the user a better ability to troubleshoot a system.
